

An approval an AI cannot forge.

How I gate ad spend.

The problem

`"confirm: true"` is something the model can type itself. That's **not a human decision**.

Gate 1, validation

Refused before anything is built if Meta would reject it.

Gate 2, the ceiling

Daily and monthly limits across the whole account. No limit set means nothing that spends will run.

Gate 3, approval

A person sees the plan and the cost, and gets a token tied to exactly that plan. Change one thing and the token is void.

Lifecycle

created paused

approved

ads and ad sets switched on

campaign switched on last

Refused if Meta rejected any ad.

Stopping is free

Pause has no gate.

A wrong pause costs some delivery.

A slow pause costs money.
